COC with; EU PACKAGING AND PACKAGING WASTE REGULATION (PPWR)

Dear Sir or Madam,

The EU Packaging and Packaging Waste Regulation (PPWR) establishes a key legal framework for the management of packaging and packaging waste. For SolarEdge and its business customers, compliance with these requirements is of high importance, as they affect both the environmental and economic aspects of the supply chain.

Within the EU context, packaging is defined as any item used to contain, protect, handle, deliver, or present goods. SolarEdge aligns its packaging strategy with the relevant European and national legal requirements, including the PPWR, waste management and circular economy legislation, as well as supply chain due diligence obligations. This includes the systematic review of packaging used, the reduction of unnecessary packaging components, the increased use of recyclable materials, and legally compliant labeling.

By doing so, SolarEdge positions itself as a company that recognizes regulatory packaging requirements and integrates them in a structured manner into its business processes.

Based on the information provided by our suppliers, our packaging currently complies with Article 5 – Requirements for substances in packaging. In particular, the following restrictions apply and are met:

Designation of the substance or group of substances	**Conditions of restriction**
Heavy Metals: • Lead • Cadmium • Mercury • Hexavalent Chromium	The combined concentration limit of the designated heavy metals present in packaging or packaging components shall not exceed **100 mg/kg**.

Should you require a statement for your specific products, we will be glad to assist you. Please contact us at Kobi.Mastey@solaredge.com.

Best Regards,
Kobi Mastey
Environmental Manager
